

MCU2000C Pedestrian Push Button Interface Module

Orange Traffic

The interface module for the MCU2000C pedestrian push button can be used to connect up to 16 push buttons to a single phase, manage up to four phases and memorize each time a pedestrian presses a button. Along with the push buttons, it forms a functional and reliable combination for pedestrian crossings at intersections.

Description

The MCU2000C is installed in the traffic light distribution and control enclosure. It is a simple plug-in module mounted on a base for easy installation and replacement.

The interface comes with four additional inputs for external controls (e.g., for different programs according to the time of day).

The MCU2000C interface is compatible with most manufacturers' push buttons subject to simply adjusting operating mode DIP switches.

The MCU2000C pedestrian push button interface module comes with a 5-year warranty.
